

DeQuervain's Tendinitis

De Quervain's Tenosynovitis

DeQuervain's tendinitis is a condition in which tendons to your thumb have been irritated. The tendons run down into your thumb through a compartment which, when irritated, causes pain. This is usually exacerbated by repetitive side to side movement of the thumb and wrist or lifting heavy objects. Your doctor may try exercises, anti-inflammatories, cortisone injections, or splinting. If your symptoms persist, they may suggest surgical intervention- 1st compartment release.

1ST DORSAL COMPARTMENT RELEASE

Your surgeon will make a cut along the inflamed compartment in order to release pressure and allow more room for the tendons. The procedure takes approximately one hour including recovery time. It is usually performed under anesthesia with sedation and local anesthetic (numbing medication) which means you will be asleep for the procedure under light sedation (less than required for general anesthesia). You will also be required to have a driver the day of surgery.

WHAT TO EXPECT AFTER SURGERY

You will need to avoid heavy lifting. You will also be instructed to keep your bandage on, clean and dry until your post-operative appointment with your surgeon. Pain medication will be prescribed for post-operative pain relief. You will wean from this medication over time as your symptoms subside. You may also experience some bruising and/or swelling. These symptoms may be alleviated through Ibuprofen or Aleve, elevation, and ice. (Please do not take additional Tylenol if you are taking narcotic pain medication; this already has Tylenol). Some temporary loss of feeling or numbness is normal. Be cautious of extreme heat or cold. Your fingers will be free to perform normal activities of daily living and it is recommended that you keep your fingers moving to prevent swelling and finger stiffness after surgery; however, we suggest you refrain from repetitive gripping and heavy lifting until after your sutures have been removed.

REASONS TO CALL OUR OFFICE

Please call our office if you experience abnormal drainage (yellow or green), fever over 100°F, chills, increasing redness around the incision site, or side effects from your pain medication such as prolonged nausea or rash.
